Technical Specifications

These specifications apply to both Models A2300 (NTSC) and A2301 (PAL) unless otherwise noted. If there is a difference between the two models, the specifications for Model A2301 will be in italics and enclosed in parentheses.

Theory of Operation

When the Genlock is attached to the Amiga 2000 computer, the system clock for the A2000 comes from the 28MHz VCO (Voltage controlled oscillator) on the Genlock unit. During the power-up sequence, the A2000's Kickstart configures the computer into an external synch mode. The Genlock unit extracts the horizontal and vertical timing information from the external source video and resets the horizontal and vertical counters of the computer so that the computer video is synched to the external video. When the external video source is removed, the computer is self-synchronized.

The Genlock also allows for video overlay of the computer graphics over the source video. The incoming composite video is decoded into RGB components, and the computer's RGB is keyed in over the external video RGB. The combined video signal then goes to the RGB output to drive an RGB monitor. It also goes to a color encoder to drive a composite video monitor or VCR.

The major system blocks of the Genlock unit are:

- 1) VCO and horizontal beam counter
- 2) Synch separator and detector
- 3) PLL (Phased locked loop)
- 4) Synch generator, color decoder timing generator, and horizontal and vertical reset generator
- 5) Color decoder
- 6) Color encoder and video overlay circuit

1. VCO and Horizontal Beam Counter

The VCO consists of TR2 and associated circuits. TR2 and varactor are the active elements of the 28.63636MHz (28.37516MHz/*PAL*) oscillator. The frequency changes approximately ± 1 MHz

as the VCO control voltage is varied ± 2 -3V around the 3.0V nominal operating point. The error voltage corresponds to the difference in phase between the horizontal synch of the source video and the computer. When they are in phase the oscillator is sitting at 28.63636MHz (28.37516MHz).

The horizontal beam counter consists of divide-by-four prescaler, IC5 and IC8, and divide-by-455 (453/PAL) counter, IC2, IC3, IC4, and IC5. The 3.58MHz (3.54MHz) clock from the computer is used to generate the 7.16MHz (7.08MHz) prescaler output, so that it has a known time relation to the color clock of the computer. This insures that the horizontal reset signal, which is derived from the H-drive, has proper set-up and hold times when sampled by the computer's color clock.

2. Synch Separator and Detector

The source video synch separator consists of TR1 and associated components. The detected composite synch goes to the rest of the board and to the external synch detector, IC13. If there are external synch missing, the synch detector circuit switches the synch source of the Genlock to the A2000, so that the computer will be self-synchronized.

3. Phased Locked Loop

The phased locked loop consists of the VCO, horizontal beam counter, and phase comparator (sample-hold and analog switch circuit for NTSC; sample-hold and voltage comparator circuit for PAL). The basic theory of the operation of the PLL is to convert the relative position of the horizontal synch of the source video and horizontal drive signal to an error voltage to control the VCO. (The horizontal drive signal mirrors the horizontal synch of the A2000.) When the PLL is locked, the burst-flag is active during the proper portion of the horizontal drive. During the off time, the voltage is pulled down to 0Vdc to cut off the IC10. When the PLL is locked, pin 3 of the IC10 will be at 3V.

4. Synch Generator, Color Decoder Timing Generator, and Horizontal and Vertical Reset Generator

The horizontal synch separator, IC9, C34, and R39, triggers the leading edge of the composite synch generator. The output of the IC9 goes to the vertical synch separator circuit and to 1/2 IC11 which recreates the 4.8 μ sec horizontal sync for the RGB connector.

The horizontal reset circuit consists of IC5 and the horizontal counter. The reset signal occurs on the alternate cycle of the horizontal beam counter. A $32\mu\text{sec/NTSC}$ ($0.55\mu\text{sec/PAL}$) reset pulse is sent to the computer at the beginning of every other line.

The vertical synch separator consists of IC9, R40 and C33. The R40 and C33 have an integrator input which filters the vertical synch information from the composite synch.

The vertical reset pulse is generated on the odd fields to reset the vertical beam counter of the computer. The field detect circuit consists of IC12, C9 and R11. The circuit is configured to detect odd fields and is connected to the vertical reset logic so that the reset to the computer is sent on the odd field.

5. Color Decoder

Once the computer video is synched to the source video, the source video is decoded by the color decoder, IC14. All of the controls for IC14 are preselected with the exception of hue. (Hue does not apply for PAL.) The RGB output of IC14 goes to the color encoder, IC15.

6. Color Encoder and Video Overlay Circuit

The color encoder, IC15, takes the RGB outputs of the color decoder and converts it to NTSC or PAL composite signals. It also has the capability of switching an external RGB signal over the decoded RGB signal. The composite output signal drives 1Vp-p into a 75 ohm load. The RGB output signal drives 0.6Vp-p into a 75 ohm load.

Component Functions

1. Variable components function

| Location No. | Name | Function |
|--------------|-------------|---|
| VR 1 | BRIGHTNESS | Brightness control for external source video input. |
| VR 2 | COLOR | Gain control of chroma amplifier for external source input. |
| VR 3 | FSC | To adjust free-running frequency of color subcarrier. |
| VR 4 | HUE | HUE control. (Does not apply to PAL.) |
| VR 5 | H-POSITION | To adjust computer composite synch timing. |
| VR 6 | BURST BLANK | To adjust burst blanking during vertical interval. |
| L6 | VCO | To adjust PLL in range. |

2. IC's function

| Location No. | Name | Function |
|--------------|---------|--|
| IC 12 | V7010 | <ul style="list-style-type: none"> • Fundamental clock generator for CPU PLL • Phase detector for CPU main clock generator • Field ID detector |
| IC 13 | NJM2220 | <ul style="list-style-type: none"> • External video signal detector by horizontal interval timing |
| IC 14 | V7020 | <ul style="list-style-type: none"> • Color decoder for external source video |
| IC 15 | V7040 | <ul style="list-style-type: none"> • Pixel switch • Composite color encoder for external video and computer • 75 ohm RGB and composite video driver |

| Location No. | Name | Function |
|--------------------------------------|---|--|
| IC 8 IC 5 | 74S74 3/4 74LS00 | <ul style="list-style-type: none"> • PLL prescaler/divide by 8 |
| IC 1 IC 2 IC 3 IC 4 IC 5 | 74LS30 74LS161 74LS161 74LS161 1/4 74LS00 | <ul style="list-style-type: none"> • PLL count down/divide by 455 (453 for PAL) • Horizontal reset pulse generator |
| IC 11 | 1/2 74LS221 | <ul style="list-style-type: none"> • Computer H-sync phase shifter |
| IC 11 | 1/2 74LS221 | <ul style="list-style-type: none"> • Horizontal sync width generator |
| IC 10 | 74HC4066 | <ul style="list-style-type: none"> • PLL select (computer or genlock) • Phase comparator and sample-hold • Composite synch select |
| IC 7 | 74AC04 | <ul style="list-style-type: none"> • Clock amp • Clock driver • Horizontal-drive current amp |
| IC 6 | 74HC00 | <ul style="list-style-type: none"> • Genlock mode selector |
| IC 9 | 74HC14 | <ul style="list-style-type: none"> • Composite synch driver • Horizontal synch separator • Vertical synch separator |

3. Mode Switch Function

Computer Only: The Genlock system provides the computer video signal. The CPU clock is generated by the V7010 fundamental clock generator and the PLL frequency multiplier. However, if external video is present, the Genlock system provides frame reset, horizontal reset, and the CPU clock. These are synchronized by the external source video timing.

Overlay Computer and Source: If an external video source is not provided, the computer is self-synchronized. If external video is present, the Genlock system provides frame reset, horizontal reset, and the CPU clock. These are synchronized by the external source video timing.

Source Video Only: The Genlock system provides the external video source only to the RGB and composite video outputs.

Connectors

1. Interface connector (to the computer)

Adjustment Procedure

NOTE: THE A2300/2301 GENLOCK ADJUSTMENTS SHOULD ONLY BE MADE BY QUALIFIED PERSONNEL USING CALIBRATED TEST EQUIPMENT. ATTEMPTS TO ADJUST THE A2300/2301 GENLOCK BY UNQUALIFIED PERSONS AND/OR FAILURE TO FOLLOW THE PROCEDURES OUTLINED HERE MAY RESULT IN UNSATISFACTORY PERFORMANCE OF THE GENLOCK UNIT AND/OR A2000 SYSTEM FAILURE. MALADJUSTMENT WILL NOT BE COVERED UNDER WARRANTY SERVICE.

Required Test Equipment

LEADER LCG-396 PATTERN GENERATOR or equivalent (NTSC)
LEADER LCG-396PAL PATTERN GENERATOR or equivalent (PAL)
HEWLETT PACKARD 5316-A FREQUENCY COUNTER or equivalent
HITACHI V-1100 OSCILLOSCOPE or equivalent
LEADER LVS-5850B VECTORSCOPE or equivalent (NTSC)
LEADER LVS-5851A VECTORSCOPE or equivalent (PAL)

Checking Calibration of NTSC (PAL) Generator

Verify 1.0 volt peak-peak video output from NTSC (PAL) Pattern Generator and chroma levels and Fig. 1 on oscilloscope display. Verify CHROMA phase angles and levels on vector-scope display. Refer to test equipment operating manuals if levels are incorrect.

Adjustment Controls

VR1 Video Output Level
VR2 Chroma Output Level
VR3 Sub-Carrier Free Run Frequency
VR4 Chroma Phase Angle (TINT)—NTSC Only
VR5 Computer Overlay Horizontal Position
VR6 Burst Holdoff
SW1 Genlock Mode Switch 3 Position

Adjustment Order

| CONTROL | INPUT | MODE SWITCH | OUTPUT | ADJUSTMENT |
|---------|-----------|---------------|--------------|------------|
| VR3 | n/a | COMPUTER ONLY | COUNTER | NOTE 1 |
| VR6 | n/a | COMPUTER ONLY | OSCILLOSCOPE | NOTE 2 |
| VR5 | n/a | OVERLAY | OSCILLOSCOPE | NOTE 3 |
| VR1 | GENERATOR | EXTERNAL ONLY | OSCILLOSCOPE | NOTE 4 |
| VR2 | GENERATOR | EXTERNAL ONLY | VECTORSCOPE | NOTE 5 |
| VR4 | GENERATOR | EXTERNAL ONLY | VECTORSCOPE | NOTE 6 |

NOTE 1: Sub-Carrier free run frequency adjust. Measure at C61 near pin 1 or 1C 14 while adjusting VR3. Be sure no external video is connected to the Genlock VIDEO IN.

NTSC 3.579545 MHZ \pm 25 HZ
PAL 4.433619 MHZ \pm 25 HZ

NOTE 2: Burst Hold-off adjust. Monitor Vertical sync'd video output from Genlock and adjust VR6 for no burst in vertical sync area.

NOTE 3: Computer overlay horizontal adjust. Monitor line sync'd video output and adjust VR5 so computer video is centered on source video.

NOTE 4: Video output level adjust. Monitor line sync'd video output and adjust VR1 for 1.0 volt peak to peak (sync tip to 100% white).

NOTE 5: Chroma output level adjust. Monitor vectorscope for best match to IRE targets while adjusting VR2.

NOTE 6: Chroma phase angle adjust. (NTSC Only) Monitor vectorscope for best match to IRE targets while adjusting VR4.

BE SURE TO HAVE A PROPER 75 OHM LOAD ON THE VIDEO OUTPUT FOR ALL MEASUREMENTS. USE ONLY 75 OHM COAXIAL CABLE FOR INTER-CONNECTIONS.

COMPONENT PARTS LIST

PLEASE NOTE: Commodore part numbers are provided for reference only and do not indicate the availability of parts from Commodore. Industry standard parts (Resistors, Capacitors, Connectors) should be secured locally. Approved cross-references for TTL chips, Transistors, etc. are available in manual form through the Service Department, order part #314000-01.
